FOREWORD

Ken Newbey collated a *Checklist of Plants: Fitzgerald River National Park* that listed the scientific name, common name, flowering month and life form of each taxon known in the park. The list was updated by Nathan McQuoid and published by Friends of the Fitzgerald River National Park (FRNP) in 1997 as a hard copy version.

The digital master copy (on Microsoft Excel) was partially updated by Gillian Craig, to reflect family, genus and name changes that have occurred since 1997 and at this time the database was reorganised into Monocotyledons and Dicotyledons, and the Families in alphabetical order, to reflect Paczkowska and Chapman's *The Western Australian Flora*. The Friends of the FRNP decided to update the checklist in 2008 and have it available in both hard copy and digital format for sale to the public.

This latest update of the checklist was done using the WA Herbarium's WACensus database, MAX3 and Florabase. Name changes and new taxa were added to the list including common names, flowering months and life form.

Ellen Hickman
June 2008

FOREWORD to the First Edition

This list is an evolution of the floristic data developed by the late Ken Newbey as part of a comprehensive biological survey of the park with Andy Chapman during 1985 to 1987.

The list was subsequently published in Aplin, T.E.H. and Newbey, K.R. *The flora of Fitzgerald River National Park, Western Australia*. Kingia Volume 1, No 2. 1990, and later in Chapman, A. and Newbey, K.R. *A Biological Survey of the Fitzgerald River Area, Western Australia*. CALM Science, Supplement three, 1995.

Ken's work on documenting the park's flora finished in 1987, and since then significant work has been undertaken in the taxonomic treatment of specimens collected by him and further field survey by others. This has provided names for many of the undescribed taxa and has revealed several new finds.

The object of this list is to continue and build upon Ken's work as a way of maintaining a current dataset of the flora and to celebrate the memory of him and his ground breaking fundamental analysis of the flora and vegetation.

This is the first in a series of updates that will continue to evolve while taxonomic treatment and surveys continue to reveal more about the botanical riches of the ever-amazing Fitzgerald River National Park.

Many people have assisted this process in a variety of ways, sincere thanks to: Anne Cochrane, Anne Kelly and Sue Bakker, CALM WA Herbarium; Angela Sanders, CALM Ravensthorpe; Dr Jenny Chappill and Kristina Lemson, University of Western Australia Botany Department; Dr Gil Craig, Ravensthorpe; Nadine Brown, Jacup; Dr Mike Crisp, Australian National University; Prof Byron Lamont and Dr Phil Groom, Curtin University; Dr Steve Hopper, Kings Park and Botanic Garden; Ian Brooker and Dr Lyn Craven, CSIRO; and members of the Friends of the Fitzgerald River National Park.

Nathan McQuoid
May 1997

INTRODUCTION

The Fitzgerald River National Park has approximately 1,660 plant taxa and new species are still being discovered each year which adds to the considerable biodiversity already discovered in the area. The south-west of Western Australia has approximately 5,700 native plant taxa which means that the Fitzgerald River National Park contains over one quarter (29%) of the south-west's flora.

It is important that the term 'taxa', as opposed to 'species', is used when discussing botanical diversity. 'Taxa' is a term that means all classification units below genus, including species, subspecies, hybrids and varieties. It better expands the notion that there are more than 'species' as the lowest denominator division of plant classification. Moreover, there is an increasing awareness of even finer distinctions of diversity when the genetics of plants are considered. It is not the function of this checklist to explore this, however it is important to mention that plants of the same 'taxa' very often exist as geographically distinct groups, a fact that makes an increased understanding of biodiversity and plant ecology ever more important for adequate conservation.

The park is also an area of significant plant endemism and about 72 taxa grow nowhere else. Most of these plants grow on the quartzite range system, although other important landforms for endemism are the incised river valleys, associated breakaways and marine plain. Of the 1,660 taxa, 130 are included on the Department of Environment and Conservation's declared rare and priority flora list.

Fitzgerald River National Park is world famous for its massive biological diversity. The reasons for the park's richness lie in the opportunities presented by the history of changing landforms and climate. This combination has created a vast diversity of dynamic niches of varying soils and habitats.

Some of the factors contributing to the park's biological diversity are:

- ◆ large area of the park - 329,000 hectares;
- ◆ a complex system of geological and landform types consisting of the southern edge of the Yilgarn granite craton, a coastal chain of low quartzite mountain ranges, a former marine plain, upland plains, breakaways, incised river valleys, swamps, lakes, creeks, estuaries and coastal dune systems;
- ◆ a climatic history that has assisted the soil types to force rapid speciation, or evolution of different taxa, upon the plants;
- ◆ a rich evolution of coastal landform patterns;
- ◆ a geological history that includes an Archean tectonic edge where Antarctica was once joined, providing a now weathered area of 'contact zone' rocks and resultant soil types;
- ◆ low nutrient levels in the soil;
- ◆ the situation of the park between arid area to the north and east and the wetter area to the west.

Patterns of the plant diversity match even the most subtle changes in soil types. This phenomenon is best observed by walking along any of the management tracks or firebreaks that are not surfaced with gravel. Notice that the change in soil type underfoot is also reflected by a change in the vegetation components and structure alongside.

The vegetation types or structures vary from tall woodlands to shrublands to heath, and these occur in various combinations. These structures are named after their dominant plant constituents, eg the tall trees in a swamp are known as Yate woodland.

The value of this great wealth of flora was recognised in 1972 when the National Park was gazetted and again in 1978 when the park became an international biosphere reserve under UNESCO's Man and the Biosphere Program.

One of the greatest threats to the floral diversity of the area is dieback and canker diseases caused by various species of fungi whose spores are spread in moist soil or by air respectively. Special protection measures are in place in the park to minimise the spread of these diseases, especially *Phytophthora cinnamomi*. **Please help us to protect the flora by taking heed of signs prohibiting access by vehicles during wet conditions and by using boot cleaning stations where they are available.**

There is still much to be learnt about the flora, and in particular the taxonomy of the families Asteraceae (daisies), Cyperaceae and Restionaceae (sedges), Orchidaceae (orchids), and the genus *Melaleuca* in the Myrtaceae family are in the midst of considerable change. It is intended that this list will be updated periodically to incorporate the changes as they occur.

This list is published by the Friends of the Fitzgerald River National Park to help increase the understanding and enjoyment of the park and to celebrate its fantastic biodiversity.

USING THE CHECKLIST

The Checklist of Plants divides the families among the Ferns and Fern Allies, Gymnosperms, Monocotyledons and Dicotyledons, reflecting the classification of Paczkowska and Chapman's *The Western Australian Flora*.

Table 1 is included to help people find the family to which a genus belongs.

The first column of the checklist (Table 2) gives the current Conservation Code of the Department of Environment and Conservation's *Declared Rare and Priority Flora List for Western Australia* (Atkins, 2008). Conservation codes are:

- R:** Declared Rare Flora – Extant Taxa (taxa in need of special protection)
- P1:** Priority One – Poorly Known Taxa (generally <5 populations which are under threat)
- P2:** Priority Two – Poorly Known Taxa (generally <5 populations, some of which are not currently endangered)
- P3:** Priority Three – Poorly Known Taxa (several populations, not currently endangered)
- P4:** Priority Four – Rare Taxa (rare, not currently threatened)

The second column includes the scientific name followed by the author who described the plant. The common name and Aboriginal name is given next (where one exists); these names have been taken from *Common and Aboriginal Names of Western Australian Plant Species* (Bennett, 1991) and *The Western Australian Flora*. The third column gives a flowering calendar which can be used as a guide, bearing in mind that flowering times can vary with the annual climatic conditions. The last column gives a brief description of the form of the plant, these again can vary depending on soil types, presence of underlying rock and exposure to wind. The plants considered by Ken Newbey to be endemic are marked '#' and the weed species are marked '*'.
